virB10 procein - Agrobacterium tumefaciens plasmid priC58
C;Species: Agrobacterium tumefaciens
C;Accession: S12360, 511835; S10525
R;Shirsau, K.; Morel, P.; Kado, C.I.
Mol. Microbiol. 4, 1153-1163, 1990
A;Fitle: Characterization of the virB operon of an Agrobacterium tumefaciens Ti plasmid:
A;Reference number: S12341; MUID:91041724; PMID:223352
A;Accession: S12350
A;Molecular type: DMA
A;Residues: 1-377 cSHI
A;Residues: 1-377 cSHI
A;Accession: S11835
A;Accessi
A; Title: Analysis of the immunoglobulin A protease gene of Streptococcus sanguis.

A; Reference number: A60272; MUID: 91100011; PMID: 1987065

A; Accession: A60272

A; Status: not compared with conceptual translation

A; Status: not compared with conceptual translation

A; Residues: 1-1668 cGIL>
C; Comment: This protein is shown from the start of translation of this gene as determine the start codon is shown in entry B60272.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Proc. 33:1389-1389(1974).

-I-PUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

-I-SUBCELLULAR LOCATION: Secreted.

-I-SINIERREN: Causes an allergic reaction in human.

-I-SIMILARITY: Belongs to the ALB/APP/VDB family.

Sheffield W.P., Syed S., Schuyler P.D., Submitted (DEC-1994) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, blilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SINSELLULAR LOCATION: Secreted.
-!- SINSUB SPECIFICITY: Plasma.
-!- SIMILARITY: Belongs to the ALB/AFP/VDB family.
-!- SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 39; DB 1; Length 608;

Thicken serum albumin (Gal d 5*) is a partially heat-labile inhalant
and food allergen implicated in the birdegg syndrome.";
Allergy Sci754-762(2001).

1. FUNCTION: Serum albumin, the main protein of plasma, has a good
binding capacity for water, Ca(2*), Na(*), K(*), fatty acids,
binding capacity for water, Ca(2*), Na(*), K(*), fatty acids,
controlled to smootic pressure of blood.

2. SUBCELLULAR LOCATION: Secreted.
C. SUBCELLULAR LOCATION: Secreted.
C. SUBCELLULAR LOCATION: Secreted.
C. MERGEN: Causes an allergic reaction in human. Binds 1gE.
Partially heat-labile allergen that may cause both respiratory and food-allergy symptoms in patients with the bird-egg syndrome.
C. SIMILARITY: Belongs to the ALB/ARPP/VDB family.
C. SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Calls for the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and calls genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying a pents (agonists and antagonists) that bind to them. Cells oxpressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins of as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoissis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukeemias.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy, stem cell growth factor; haematopoiesis; tissue growth factor; mmunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27352 encode the human ORFX in the specification). ABN15762 to ABN27352 encode the human ORFX proteins given in ABP60010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated with an ORFX-associated with ORFX-associated with ORFX-associated disorder. ORFX polymucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, circhosis of liver, contains, benign tumours, keloid, degenerative disorders, haemorinage, osteoarthritis, neurodegenerative disorders, circhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, infectious cortange in the contains and partial or an infectious disorders, disorders, infectious cortange disease, autoimmune disorders send and disorders, infectious disease, autoimmune inflammatory eye disease. ORFX proteins are also arthitis, autoimmune inflammatory eye disease. ORFX proteins are also disease and autoimmune inflammatory eye disease. ORFX proteins are also consein for treating burns, indications, ulcers, for treating observation and treatment of lung or liver fibrosis, bone degenerative diseases, autoinfliens rissues and conditions resulting from part of the printed specification, but was obtained in electronic former directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                               Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperporliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel human polypeptides and polymucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapentic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the runciel cacids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or atimulation; as anti-inflammatory agents; and in treatment of leukaemias. AMU29510-AAMU3304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

     The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and calls genetically engineered to express them are also useful for producing the proteins. The proteins of as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoisals, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation, as anti-inflammatory agents; and in treatment of leukaemias. ANU29510-AAU33304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                      Human, vaccination, gene therapy, nutritional supplement, stem cell proliferation, haematopoiesis, nerve tissue regeneration, immune stimulation, anti-inflammatory, leukaemia.

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to each state also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to requiate hemanatopiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. Adults of the present the amino acid sequences of novel human
Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                          The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concataent. The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatory disorder or autoimmune disorder, including rheumatoid arthritis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uveitis and coeliac disease. The present sequence is a protein described in the exemplification of the

The invention describes a method of modulating an immune response in a mammal, comprising identifying a mammal that has or is at risk for having comparising identifying a mammal that has or is at risk for having comprising an un-methylated CDG sequence to the mammal, (NI) an isolated nucleic acid (NI) comprising sequence to the mammal, the mammal; or nucleic acid (NI) comprising sequence encoding alpha-MSH to the mammal. The cor or (c) a peptide that binds to a melanocortin receptor to the mammal. The method is useful for modulating immune response in a mammal having a complating immune response. Preferably, the method is useful cof one or more symptoms of the disorder. Preferably, the method is useful cor for modulating immune response in a mammal having bladder cancer (where daministration of (NI) results in a modulation of the cystitis (where administration of (NI) results in a modulation of the cystitis (where administration of (NI) results in a modulation of the immune response in a mammal having bladder disorder concerning immune response in a mammal having bladder disorder that is characterised by inflammation which is associated with superconforming the bladder lining in the craption of the integrity of the bladder lining in the craption of melanocyte calbumin residues 1-195 that can be used in the creation of melanocyte cor fusion protein when expressed in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                    Modulating immune responses in a mammal with a bladder disorder e.g. bladder cancer, by administering nucleic acids comprising un-methylated CpG sequences, nucleic acids encoding alpha-MSH, or alpha-MSH peptides to the mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant; human serum albumin; HSA; yeast codon bias; host cell; overlapping oligonucleotide; expression vector.

The method relates to a method of recombinantly producing human serum albumin (HSA) in yeast by altering the coding sequence of HSA to comprise a yeast codon bias. The complete HSA gene (AAA10091) was generated as three synthetic fragments (AAA10092-A.10094) joined by recombinant DNA technology. Each HSA fragment was synthesised from overlapping oligonucleotide fragments that were extended. This sequence represents the sequence of the HSA fragment HSA-I encoded by the human gene with a yeast codon bias. The invention also covers a recombinant expression the process for producing human serum albumin in the yeast host cell, especially in secretory mode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid encoding fusion protein comprising alpha-melanocyte stimulating hormone concatamer or its analog, for treating inflammatory
                                                             Process for preparing recombined human serum albumin comprising yeast biased sex codons - uses a recombinant DNA technique.

The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system
                                     The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concataent. The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatory arthritis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uveitis and coeliac disease. The present sequence is a peptide described in the exemplification of the

The invention describes a method of modulating an immune response in a mammal, comprising identifying a mammal that has or is at risk for having a badder disorder. And administering: (a) an isolated nucleic acid (NI) comprising an un-methylated CpG sequence to the mammal; (b) an isolated nucleic acid (N2) comprising sequence encoding alpha-MSH to the mammal; or (c) a peptide that binds to a melanocortin receptor to the mammal. The method is useful for modulating immune response in a mammal having a bladder disorder, where administration of (NI) results in an amelioration of one or more symptoms of the disorder. Preferably, the method is useful for modulating immune response in a mammal having bladder cancer (where administration of (NI) results in a decrease in tumour size or activity), or for modulating immune response in a mammal having interstitial cystitis (where administration of (NI) results in a modulation of the immune response from Th2 response to a Th1 response). The method is also useful for modulating immune response in a mammal having bladder disorder
                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modulating immune responses in a mammal with a bladder disorder e.g. bladder cancer, by administering nucleic acids comprising un-methylated CpG sequences, nucleic acids encoding alpha-MSH, or alpha-MSH peptides to the mammal.
e.g. inflammatory disorder or autoimmune disorder, including rheumatoid arthritis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uvoitis and coeliac disease. The present sequence is a protein described in the exemplification of the

The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatori hypersensitivity, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uveitis and coeliac disease. The present sequence is a protein described in the exemplification of the
that is characterised by inflammation which is associated with symptoms of interstitial cystitis or associated with a disruption of the integrity of the bladder lining. This is the amino acid sequence of a human serum melanocyte stimulating hormone (alpha-MSH) concatamer useful in the trearment of bladder disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acid encoding fusion protein comprising alpha-melanocyte stimulating hormone concatamer or its analog, for treating inflammatory or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alpha-MSH; inflammation; autoimmune disease; gene therapy; sepsis; alpha-melanocyte stimulating hormone; rheumatoid arthritis asthma; cirrhosis; dermatitis; psociasis; inflammatory bowel disease; immunosuppressive; antinflammatory; antirheumatic; antiarthritic; antiasthmatic; antibacterial; dermatological; antiasthmatic; antibacterial; dermatological; antiasthmatic; antiathritic; disease; obthalmological; neuroprotective; multiple sclerosis; diabetes; uveitis; coeliac disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concataener. The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatoid arthritis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uveitis and coeliac disease. The increase a protein described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid encoding fusion protein comprising alpha-melanocyte stimulating hormone concatamer or its analog, for treating inflammatory or autoimmune disorders.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 3, App

Sequence 3, Application US/08448196A

Patent No. 5780594

GENERAL INFORMATION:
APPLICANT: CRAFER, DANIEL C.
TITLE OF INVENTION: ELOLOGICALLY ACTIVE PROTEIN FRAGMENTS
TITLE OF INVENTION: CONTAINING SPECIFIC BINDING REGIONS OF SERUM ALBUMIN OR TITLE OF INVENTION: RELATED PROTEINS
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: NASA
STREET: MARSHALL SPACE FLIGHT CENTER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MANEAKEY: Region

Patent No. 6663485

GENERAL INFORMATION

APPLICANT: Ball et al.

TITLE OF INVENTION: Chemokine Beta-1 Fusion Proteins

TITLE OF INVENTION: Chemokine Beta-1 Fusion Proteins

CURRENT APPLICATION NUMBER: US/10/153,064

CURRENT FILING DATE: 2002-05-24

PRIOR APPLICATION NUMBER: 60/293,212

PRIOR PILING DATE: 2001-05-25

NUMBER OF SEQ ID NOS: 137

SEQ ID NO 5

LENGTH: 585
                                          MBER: US/08/769,746

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

M.Alternate names: phosphomannose isomerase

C,Species: Homo sapiens (man)

C,Date: 07-599-1994 #sequence_revision 10-Nov-1995 #text_change 08-Oct-1999

C,Accession: S41122; S38666

B,Froudfoot, A.E.I.; Turcatti, G.; Wells, T.N.C.; Payton, M.A.; Smith, D.J.

Eur. J. Blochem. 219, 415-421, 1994

A,Title: Purification, CDNA cloning and heterologous expression of human phosphomannose

-i- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water. (24), Na(+), K(+), fatty acids, normones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

-i- SUBCELLULAR LOCATION: Secreted.

-i- TISSUE SPECIFICITY: Plasma.

-i- ALERGEN: Causes an allergic reaction in human.

-i- SIMILARITY: Contains 3 albumin domains.

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SINGELIVIAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Plasma.
-!- SIMILARITY: Contains 3 albumin domains.

-!- PATHWAY: Glycosylation, early steps of mannosylation.
-!- PATHWAY: Glycosylation, early steps of mannosylation.
-!- SUBCELULIAR LOCATION: Cytoplasmic (Probable).
-!- TISSUE SPECIFICITY: Expressed in all tissues, but more abundant in heart, brain and skeletal muscle.
-!- DISEASE: Defects in MPI are the cause of congenital disorder of glycosylation type ID (CDG-ID) [MIM:602579]; also known as carbohydrate-deficient glycoprotein syndrome type IB (CDG-IB).
CDG-ID is clinically characterized by protein-losing enteropathy, a gastrointestinal disorder. Biochemically it is characterized by hypoglycosylation of serum glycoproteins.
-!- SIMILARITY: Belongs to the mannose-6-phosphate isomerase family 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=98192671; PubMed=9525984; Michues R., Hadalik M., Alton G., Koerner C., Schiebe-Sukumar M., Nichhues R., Hadalik M., Alton G., Koch H.G., Zimmer K.-P., Wu R., Harms E., Reiter K., von Figura K., Freeze H.H., Harms H.K., Marquardt T.; "Carbohydrater-deficient glycoprotein syndrome type Ib: phosphomannose isomerase deficiency and mannose therapy."; Clin. mannose supplementation."
Mol. Genet. Metab. 73:77-85(2001).
-!- FUNCTION: Involved in the synthesis of the GDP-mannose and
dolichol-phosphate-mannose required for a number of critical
mannosyl transfer reactions.
-!- CATALYTIC ACTIVITY: D-mannose 6-phosphate = D-fructose 6-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VARIANTS CDG-IB THR-139 AND GLN-218.

Gene 153:287-288(1995).
Gene 153:287-288(1995).
-!- FUNCTION: Possible role in the transport of yet unknown ligand.
-!- SUBCELLULAR LOCATION: Secreted.
-!- PTM: N-glycosylated.
-!- PTM: N-glycosylated.
-!- SIMILARITY: Belongs to the ALB/AFP/VDB family.
-!- SIMILARITY: Contains 3 albumin domains.

M. Hordrow Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilitubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

M. SUBCELDULAR LOCATION: Secreted.

M. SUBMEDITITY: Belongs to the ALB/APP/VDB family.

MILARITY: Belongs to the ALB/APP/VDB family.

"Sequencing of cDNA encoding serum albumin and its extrahepatic

"Sequencing of cDNA encoding serum albumin and its extrahepatic

"Sequencing of cDNA encoding serum albumin and its extrahepatic

"I EUNCTION: Serum albumin, the main protein of plasma, has a good

"I EUNCTION: Serum albumin, the main protein of plasma, has a good

"I EUNCTION: Serum albumin, the main function is the regulation

of the colloidal osmotic pressure of blood.

"I SUBCELLUIAR LOCATION: Secreted.

"I ISSUE SPECIFICITY: Plasma.

"I ISSUE SPECIFICITY: Plasma.

"I SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. but of 15:205-212(1993).

- I-FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

- I-SUNCELULAR LOCATION: Sercted.

- I-TISSUE SPECIFICITY: Plasma.

- I-TISSUES SPECIFICITY: Plasma.

Submitted (SEP-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Possible role in the transport of yet unknown ligand.
-!- SUBCELIULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the ALB/AFP/VDB family.
-!- SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mus musculus (Mouse).
